Appendix A. Chemicals Identified in Hydraulic Fracturing Fluids and/or Flowback and Produced Water

A.1. Supplemental Tables and Information

1 The EPA identified authoritative sources for information on hydraulic fracturing chemicals and, to
2 the extent possible, verified the chemicals used in hydraulic fracturing fluids and detected in
3 flowback and produced water of hydraulically fractured wells. The EPA used 10 sources to identify
4 the chemicals used in hydraulic fracturing fluids or detected in flowback or produced water. Seven
5 sources are government entities (Congressional, federal, or state) that obtained the data directly
6 from industry. The remaining three represent collaborations between state, non-profit, academic,
7 and industry groups. FracFocus is the result of a collaboration between the Ground Water
8 Protection Council (a non-profit coalition of state ground water protection agencies) and
9 the Interstate Oil and Gas Compact Commission (a multi-state government agency). The Marcellus
10 Shale Coalition is a drilling industry trade group. [Colborn et al. \(2011\)](#) is a peer-reviewed journal
11 article. Most of the listed chemicals were cited by multiple sources.

12 Seven of the ten sources obtained information about the chemicals used in hydraulic fracturing
13 fluids from material safety data sheets (MSDSs) provided by chemical manufacturers for the
14 products they sell, as required by the Occupational Safety and Health Administration (OSHA). The
15 MSDSs must list all hazardous ingredients if they comprise at least 1% of the product; for
16 carcinogens, the reporting threshold is 0.1%. However, chemical manufacturers may withhold
17 information (e.g., chemical name, concentration of the substance in a mixture) about a hazardous
18 substance from MSDSs if it is claimed as confidential business information (CBI), provided that
19 certain conditions are met ([OSHA, 2013](#)).

Table A-1. Description of sources used to create lists of chemicals used in fracturing fluids or detected in flowback or produced water.

The number next to each citation in the reference column corresponds to numbers in the reference columns found in Table A-2, Table A-3, and Table A-4.

Description / Content	Reference
Chemicals and other components used by 14 hydraulic fracturing service companies from 2005 to 2009 as reported to the House Committee on Energy and Commerce. For each hydraulic fracturing product reported, companies also provided an MSDS with information about the product's chemical components.	House of Representatives (2011)^a (1)

This document is a draft for review purposes only and does not constitute Agency policy.

Description / Content	Reference
Chemicals used during natural gas operations with some potential health effects. The list of chemicals was compiled from MSDSs from several sources, including the Bureau of Land Management, U.S. Forest Service, state agencies, and industry.	Colborn et al. (2011)^a (2)
Chemicals used or proposed for use in hydraulic fracturing in the Marcellus Shale in New York based on product composition disclosures and MSDSs submitted to the New York State Department of Environmental Conservation (NYSDEC). Also includes data provided separately to NYSDEC by well operators on analytical results of flowback water samples from Marcellus Shale operations in Pennsylvania and West Virginia.	NYSDEC (2011)^{a,b} (3)
Chemicals reported to be used by nine hydraulic fracturing service companies from 2005 to 2010. Companies provided the chemical names in MSDSs, product bulletins, and formulation sheets.	U.S. EPA (2013a)^a (4)
MSDSs provided to the EPA during on-site visits to hydraulically fractured oil and gas wells in Oklahoma and Colorado.	Sheets
Characteristics of undiluted chemicals found in hydraulic fracturing fluids associated with coalbed methane production, based on MSDSs, literature searches, reviews of relevant MSDSs provided by service companies, and discussions with field engineers, service company chemists, and state and federal employees.	U.S. EPA (2004)^a (6)
Chemicals used in Pennsylvania for hydraulic fracturing activities based on MSDSs provided by industry.	PA DEP (2010)^a (7)
Chemical records entered in FracFocus by oil and gas operators for individual wells from January 1, 2011, through February 28, 2013. FracFocus is a publicly accessible hydraulic fracturing chemical registry developed by the Ground Water Protection Council and the Interstate Oil and Gas Compact Commission. Chemicals claimed as confidential business information (CBI) do not have to be reported in FracFocus.	U.S. EPA (2015c)^a (8)
Chemicals detected in flowback from 19 hydraulically fractured shale gas wells in Pennsylvania and West Virginia, based on analyses conducted by 17 Marcellus Shale Coalition member companies.	Hayes (2009)^b (9)
Chemicals reportedly detected in flowback and produced water from 81 wells provided to the EPA by nine well operating companies.	U.S. EPA (2011b)^b (10)

^aSources used to identify chemicals used in hydraulic fracturing fluids.

^bSources used to identify chemicals detected in flowback and produced water.

- 1 Once it had identified chemicals used in hydraulic fracturing fluids and chemicals detected in
- 2 flowback/produced water, the EPA conducted an initial review of the chemicals for preliminary
- 3 validation of provided chemical name and Chemical Abstracts Service Registry Number (CASRN)
- 4 combinations. A CASRN is a unique numeric identifier assigned by the Chemical Abstracts Service
- 5 (CAS) to a chemical substance when it enters the CAS Registry Database. The EPA Office of Research

This document is a draft for review purposes only and does not constitute Agency policy.

1 and Development's National Center for Computational Toxicology (NCCT) provided the final formal
2 validation and verification of the listed chemicals.

3 The EPA first compared the hydraulic fracturing chemical CASRNs and names with chemicals listed
4 in NCCT's Distributed Structure-Searchable Toxicity Database network (DSSTox) database ([U.S.
5 EPA, 2013b](#)). For the CASRNs and chemical names that did not appear in the DSSTox database, the
6 EPA's Substance Registry Services database and the U.S. National Library of Medicine ChemID
7 database were used to verify accurate chemical name and CASRN pairing ([NLM, 2014; U.S. EPA,
8 2014c](#)). The EPA also identified cases where CASRN/name combinations could not be verified by
9 use of selected public sources and flagged those cases for resolution by NCCT.

10 NCCT then verified all of the CASRN and chemical names for the chemical lists generated by the EPA
11 in accordance with NCCT DSSTox Chemical Information Quality Review Procedures
12 (<http://www.epa.gov/ncct/dsstox/ChemicalInfoQAProcedures.html>). The process included QA/QC
13 on the identification and validation of CASRN/chemical name combinations and resolution of
14 inconsistencies and problems including duplications, CASRN errors, and CASRN/chemical name
15 mismatches.

16 The general methodology for resolving conflicts between CASRN/chemical name combinations and
17 other chemical identification issues differed slightly depending on the data provided by each
18 source. To resolve chemical/CASRN conflict in data provided by the nine service companies, the
19 EPA worked with each company to verify the CASRN/chemical combinations proposed by NCCT. In
20 cases of CASRN/chemical name mismatches in data provided by FracFocus, chemical names were
21 considered primary to the CASRN (i.e., the name overrode the CASRN). When the chemical name
22 was non-specific and the CASRN was valid, then the CASRN was considered primary to the chemical
23 name, and the correct specific chemical name from DSSTox was assigned to the CASRN. For all other
24 sources, the CASRN was considered primary unless it was invalid or missing. In such cases, the
25 chemical name was primary. All Toxic Substance Control Act (TSCA) CBI chemical lists were
26 managed in accordance with TSCA CBI procedures.

27 Chemicals with verified CASRNs that are used in hydraulic fracturing fluids are presented in Table
28 A-2. Generic chemicals used in hydraulic fracturing fluids are presented in Table A-3. Chemicals
29 with verified CASRNs that have been detected in flowback or produced water are presented in
30 Table A-4. Chemicals found in both fracturing fluids (see Table A-2) and flowback and produced
31 water (see Table A-4) are italicized in each table.

Table A-2. Chemicals reported to be used in hydraulic fracturing fluids.

An "X" indicates the availability of physicochemical properties from EPI Suite™ (see Appendix C) and selected toxicity reference values (see Appendix G). An empty cell indicates no information was available from the sources we consulted. Reference number corresponds to the citations in Table A-1. Italicized chemicals are found in both fracturing fluids and flowback/produced water.

Table A-4. Chemicals detected in flowback or produced water.

An "X" indicates the availability of physicochemical properties from EPI Suite™ and selected toxicity reference values (see Appendix G). An empty cell indicates no information was available from the sources we consulted. Reference number corresponds to the citations in Table A-1. Italicized chemicals are found in both fracturing fluids and flowback/produced water.
